

Finding Empirical Truth in the Social Sciences

A Paper by Bradford Harrison

"There are things known and there are things unknown, and in between are the doors." – Jim Morrison

"What we cannot speak about we must pass over in silence." – Wittgenstein

As a species on planet Earth, we've come to understand that there is a gaping disconnect between our ability to deploy science and technology successfully while, at the same time, utterly failing to deploy successful political and other *social* systems.

In this paper I show that the social sciences like political science and sociology are in fact hard sciences on a par with the natural sciences. The only difference is one of degree. I argue that the reason the human species has done such a dismal job of deploying its political and other social systems when compared with the "successful" deployment of natural science and technology is because we fail to understand that the political and other social sciences are absolutely to be pursued as methodological and scientific in exactly the same way as any natural science.

As a species, we've made stunning "progress" in the physical sciences, but little if any progress in the social sciences. If we aren't able to develop social sciences that give us solutions to our societal and basic survival problems, there's no hope for a stay that lasts much longer on Earth. Hard science has given us about as much as it can; now's the time for social science to take the wheel. Our very survival depends on it.

The American broadcast media and social media have become inundated with propaganda and falsities. Investigative journalism is all but dead now as advertising dollars pour into social media and far right-wing media, where there absolutely is no truth. Besides the mostly innocuous bandying about of social blather on social media sites, there are only financial, political, and oligarchic power issues getting

propagated and discussed. Politics in America today is all about how much money a candidate has to spend (or how much is used against him) and – more importantly – *who* is giving him money (or giving it to his political enemies). In 2024, America inexplicably re-elected Donald Trump for a second term, due solely to the power of propaganda, money, and lies. What so-called MAGA voted to get now bears no resemblance to what they're actually getting. They were duped by the super-rich powers-that-be, including Donald Trump himself (the poster boy for the rich), and now the oligarchy is having a heyday and has already increased their wealth by literally \$trillions in the space of just a little over one year. Such is the power of today's propaganda, money, and lies. Today, as I edit the final draft of this paper, America is learning that even though Trump says he already won the Iran war, he will continue bombing "for fun." He says he originally began bombing Iran because Iran was three days away from attacking America, even though there is no evidence of this. Iran doesn't even have the weaponry to do that, which at the very least would require an intercontinental ballistic missile (ICBM). Then, to make matters worse, his FCC commissioner just came out and said that he (the commissioner) will be revoking the broadcast license of any media outlet that doesn't support Donald Trump and the war. The Constitution and the First Amendment are pretty much done with in America now. Such a shame. I don't even know my homeland anymore, but I'm too old to go somewhere else. If I were in my 20s, I absolutely would.

But we can get back on a sane path by, quite simply, leveraging empirical truth to our advantage rather than to our disadvantage. Scientific truth has given us the technology upon which we have created this mess, and now we must focus on social truth to redirect us from the suicidal path on which the super-rich, super-powerful powers-that-be have led us all. Simply training our minds to not be swayed by propaganda and lies will be the beginning of our salvation. We don't need tons of money to make this happen. We just need tons of common sense.

I used to be of the opinion that humankind has a great future ahead in space – and not just in our solar system. I am still convinced that we have the wherewithal to get to Mars and even "nearby" exoplanets, but it has become pretty clear to me that these tasks will prove monumental and will take time and resources that we just don't have right now – and possibly never will. We're clearly stuck right here on Earth, at least for now, and we'd better clean up our act if we intend for the great humans-on-Earth experiment to continue.

The known and the unknown

Human beings aren't nearly as smart as we like to think we are. We have this view of ourselves as possessing great and knowledgeable brains that can understand anything if we just try hard enough. But that's false. The early philosophical empiricists of the Enlightenment like David Hume and John Locke showed us that we learn by observation, not just by "thinking on" things. Hume showed us the consequences of the problem of induction – i.e., that we are hard pressed to show *any* "facts" about nature that are *guaranteed* factual as opposed to our assuming them to be correct simply because we've shown them before. There is no guarantee that the sun will rise tomorrow. We just assume that it will because it always has.

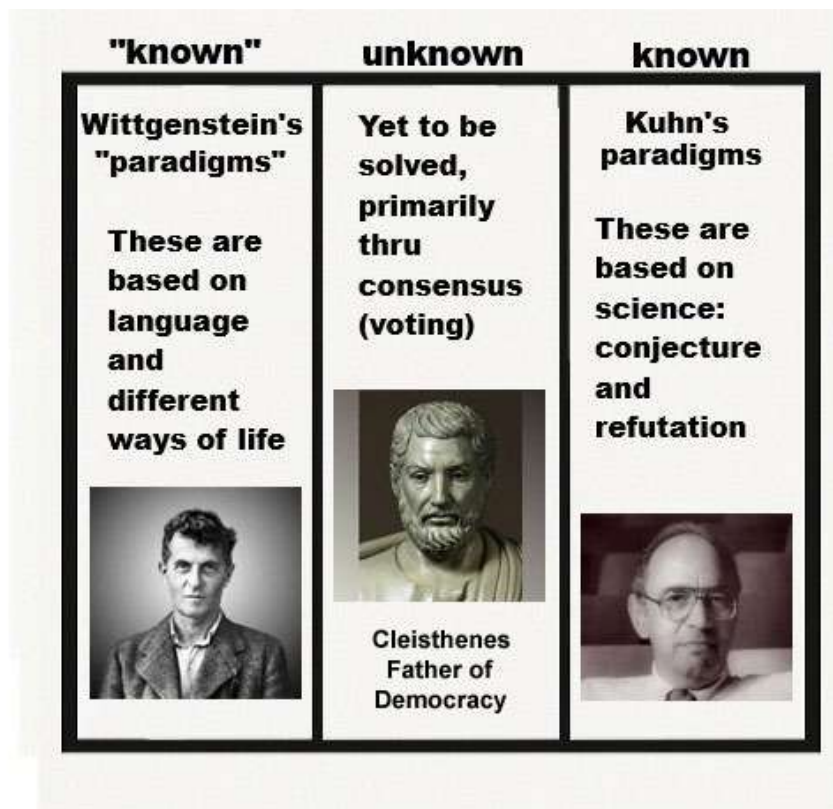

It is confessed that the utmost effort of human reason is to reduce the principles productive of natural phenomena to a greater simplicity, and to resolve the many particular effects into a few general causes, by means of reasonings from analogy, experience, and observation. But as to the causes of these general causes, we should in vain attempt their discovery, nor shall we ever be able to satisfy ourselves by any particular explication of them. These ultimate springs and

principles are totally shut up from human curiosity and inquiry. – From Hume's *An Inquiry Concerning Human Understanding* (1748)

People put great hope in hard science, still. They talk of getting to Mars and then onto an exoplanet somewhere. But the problems in accomplishing this that are shown to us by today's physicists and engineers will take decades – even centuries – to solve, if they can ever be solved at all. And we are running out of time to fix this mess we're in. No one's going to come save us, and we certainly won't be able to simply abandon a planet we destroyed and just "up and go" to someplace else. Similarly, fantasies about fantastic colonies in near-space where we can happily carry on will remain – at least for now – strictly in the realm of science fiction. We have neither the time nor the resources to get that done. We're having trouble just getting back to the moon.

Most social sciences are pretty easy to identify. Political science, psychology, sociology and economics are obviously social sciences. On the other hand, the study of anthropology is divided into cultural anthropology and physical anthropology. Physical anthropology is "hard" science-based and studies the physical world, mostly without bias. Cultural anthropology looks at societies and civilizations in an attempt to understand them. Anthropology straddles the line between social science and hard science, which makes it interesting in itself, but also demonstrates that social and natural sciences aren't really all that different.

The chart below shows how the distinction between physical and social science relates to epistemology in general. You have the hard sciences, which are equivalent to physical anthropology, and you have cultural anthropology and the other social sciences, which aren't strictly "factual" in the same sense as the hard sciences. Where the two sides meet – the unknown – is the core subject of this paper.

Note: The column on the right, known, also includes hard facts that we, as humans, can assert based on the best available empirical evidence. For example, Trump's loss of the 2020 election can be included here. There are virtually *no empirical facts* that demonstrate his assertion that he won. That lie certainly wins the distinction of being the biggest political lie of the 21st century – at least so far. It has also been the most influential, unfortunately for America.

And you shall know the truth, and the truth shall make you free

There *is* empirical truth, and we *can* find it. This absolutely must be our primary and core activity if we want to survive as a species. That's *somewhat* easier in the natural sciences because we can verify, validate and reproduce what is true. In the social sciences, we just have to work a bit harder.

Note: I should mention here that of course there are many examples of absolutely Herculean efforts by natural scientists to prove scientific hypotheses. The story of how Einstein's theories were proved by measuring the shift in light as an eclipse occurred is a case in point. This single proof changed a Newtonian paradigm forever and made Einstein a world famous figure overnight. There have been similar events in the history of the social sciences, but breakthroughs in the social sciences are rarely as dramatic, even though they may be just as difficult to achieve.

When looking for what we can confidently assert to be true, I always start with the logical positivists and Ludwig Wittgenstein's *Tractatus Logico Philosophicus*. Then I use Kuhn to show the holes. Social science has the same holes – they are just bigger. Wittgenstein, great genius that he was, addressed both scientific paradigms and social paradigms, though he called social paradigms "language games."

Truth Table	
Logical Positivism	For scientists. Also known as <i>Logical Empiricism</i> . This is scientific truth—facts that can be reproduced by anyone, anytime. See <i>Vienna Circle</i> . See <i>Tractatus Logico-Philosophicus</i> .
Scientific Paradigms	For physicists. Even with scientific facts, scientific truth is elusive. Perception affects even scientific hypotheses and conclusions. See <i>The Structure of Scientific Revolutions</i> . See Wittgenstein's concept of "pictures" in <i>Tractatus Logico-Philosophicus</i> .
Social Sciences	For social scientists. See Chomsky vs. Skinner. To what extent can you apply the hard sciences approach to the social sciences? See <i>Language and Mind</i> . See <i>The Blue and Brown Books</i> .
Consensus	For liberals and conservatives. Debate and agreement. See <i>News Flanks</i> . See <i>Sonny's Utopia</i> .
Moral Relativism	For hippies and Trump supporters. The further left and the further right you go, the more perception becomes reality. Empirical proof not needed. See https://bradfordharrison.github.io/Against_Hierarchy.pdf . See <i>The Idea of a Social Science</i> .
Faith	For monks, priests and preachers. <i>A priori</i> truth. See <i>Critique of Pure Reason</i> . See <i>The Bible</i> .

The Vienna Circle was a group of physicists and philosophers early in the 20th century who philosophized with regard to how science can deliver unequivocally true information about nature. Logical positivism is a philosophical term used to explain the process of discovering and documenting verifiable, validatable, and reproducible scientific truth. Ludwig Wittgenstein provided a sort of handbook to the logic behind logical positivism, referenced by scientific philosophers to support how humans interact with the natural environment with a deductive methodology that ensures the validity of our scientific information.

Later in the century, an academic named Thomas Kuhn wrote a stunning expose of how we *actually* do science, and how scientific research and analysis is in fact something of a *social* activity that moves through a series of “paradigms.” Paradigms explain scientific discoveries, but “anomalies” develop in the paradigms, leading to new paradigms. Kuhn admitted that in some sense this makes scientific inquiry “relativistic,” but when we look at the real-world results, we cannot deny that scientists aren’t just spinning their wheels but certainly *are* making progress in understanding and manipulating the natural world.

Social science progresses in a similar fashion. The discoveries of social science aren’t as obvious or as “easy” to validate and reproduce, but they nonetheless do represent real progress. Cultural relativism plays a very active part in this process. Diversity of thought and values provide a range of input into the Kuhnian-like paradigms of social science. Consensus among majorities in society and the world provide the paradigms that get tested by civilization. The trick is to keep moving forward like natural science does, and to keep developing social truths that ensure our survival on the planet and make everyone’s life better.

Without guardrails, cultural and moral relativism can become meaningless. This is why the social sciences are so difficult. It’s hard to keep the paradigms of social science from “winging off” into complete chaos and total nonsense. The extremism of the Nazis and, most recently, the genocide of the Palestinians in Gaza are examples that can be framed within paradigms *somewhat* useful to the social sciences, but the conditions that allow such paradigms and realities to form and gain influence must be strictly monitored, controlled, and eventually eliminated. Horrors are useful only if studied once – and that’s all.

Certainly there are plenty of other nonsensical human activities studied by social scientists that aren’t as dangerous. Everyday cultism and most religious activities come to mind. But as long as the effects of these paradigms and ways of life are limited in any sort of real-world damage they can do (like the white nationalism of the Trump cult or the everyday exploitation seen in Scientology) then they can actually provide *some* repeatable and useful input into how society moves forward. *But they must be victimless.* The founding fathers of America believed wholeheartedly (and with good reason) in the separation of church and state. Free speech is critical, but manipulation, propaganda, and exploitation are to be avoided at every turn.

Victimless lies and victimless values

Lies that harm others are clearly wrong and must be exposed and addressed. On the other hand, victimless lies and values are harmless and don’t hurt anyone. They are often a key part of someone’s personal belief system, so should be “honored,” but they are useful only to the degree that they contribute to empirical knowledge in terms of empirical explanation of how society works and how we can make it better. Whimsical beliefs and fairy tales give us hope and make our lives better, but they are mostly useless. Belief in a heaven while your enemies roast in hell falls under the category of victimless lies and beliefs. But if that’s what gets you through the night, believe on!

Values are bonding mechanisms for sub-groups within the larger culture, but can also be very identifiable in the over-arching culture as meta-values. Values are at the heart of sociological paradigms. The Ku Klux Klan’s values are a clear example of bonding values that are *certainly not victimless*, and are also mirrored in the larger society, perhaps even in international values. Religious organizations are

examples of groups sharing victimless values and beliefs like eternal life and eternal torture in hell. But when these beliefs are taken to another level and codified into laws that are clearly exploitative and dangerous – like forcing a woman who was raped to have the resulting baby, on religious principles – then they become truly dangerous and absolutely harmful.

In the 70s, my generation and my peers in America learned the details of the American Indian and their ways of life. We were impressed with their relationship to nature and their lifestyles that kept their relationship with nature non-exploitative and sustainable. Of course, the American Indian was brutally destroyed under the doctrine of manifest destiny (just like Trump is pursuing some twisted version of the Monroe Doctrine today), but my generation became well informed by studying this uniquely American history. We are moved by the plights of other indigenous cultures and environments as well, like the people of the Amazon rainforest. The Amazon is home to approximately 1.5 million indigenous people belonging to over 350 different ethnic groups. These people act as vital guardians of the rainforest's biodiversity. The American Indian was the same. The values I am presenting in this paper are the direct result of the values I developed as a young “baby boomer” in America. We are what Trump and his cult now egregiously refer to as “woke.”

Open democratic society and a healthy and prospering natural environment are critical to fostering groups and sub-groups that share victimless values. These groups are key voting participants that very much help us find universal values that are universal in the same way as scientific “laws” appear to be universal.

Return to the Dark Ages

Most of what I have to say here can be demonstrated through the lens of politics and political science. Currently America is living through the shit-show called the Trump administration, so it is certainly helpful for me to make my core argument by referencing today's political environment. Similar examples of the rise of authoritarianism, totalitarianism, autocracy, and fascism – whatever you want to call it – are easy to find around the world today, but Trumpism is what I know and is what I have unfortunately lived through. Authoritarianism, totalitarianism, autocracy, fascism, Trumpism – these spell the “end of days” for humanity, and if we don't stop them we will wind up with a planet that is not habitable by any human or, for that matter, any other creature.

Trump's “castle” under his “golden dome” (a fantasy missile defense system) is a return to the Dark Ages of moats and fortresses. Trump and the rest of today's authoritarians/autocrats represent the end of the Enlightenment and a throwback to the days before Locke and Hume – and the creation of the U.S. Constitution. Orwell showed us how authoritarians and dictators operate. Trump's “truth social” website is the epitome of what Orwell detailed in his great books. Many, many examples of Orwellian dystopianism in Trumpism are easy to find. I won't bother to do more of that here.

The Dark Ages were largely characterized by religious superstition and the rule of kings. Humankind followed authority and hierarchy blindly, and with Trump we now clearly see that same phenomenon in America today. Belief in Trump is an act of faith. There are mounds of empirical evidence to refute the veracity of nearly everything Trump says, but his ability to leverage cultism, bigotry, superstition, conspiracy theory, and religiosity has no parallel in modern American history. Indeed, Trump represents not only a throwback to the Dark Ages, but also to the more American saga of the Pilgrims and Puritans, and the culture of Cotton Mather.

American voters put Trump into power twice. During his first term, he didn't really understand what he had and he failed through his own stupidity (thankfully) to fully exploit his position and power to the same criminal extent that he is now doing during his second term.

American democracy suffered a stunning failure when it elected Trump the second time. MAGA gave Trump the reins to a country already great and to a great democracy (but with a stupidly large military-industrial complex), and he is causing damage that will take years or maybe even decades to reverse – if the damage is reversible at all.

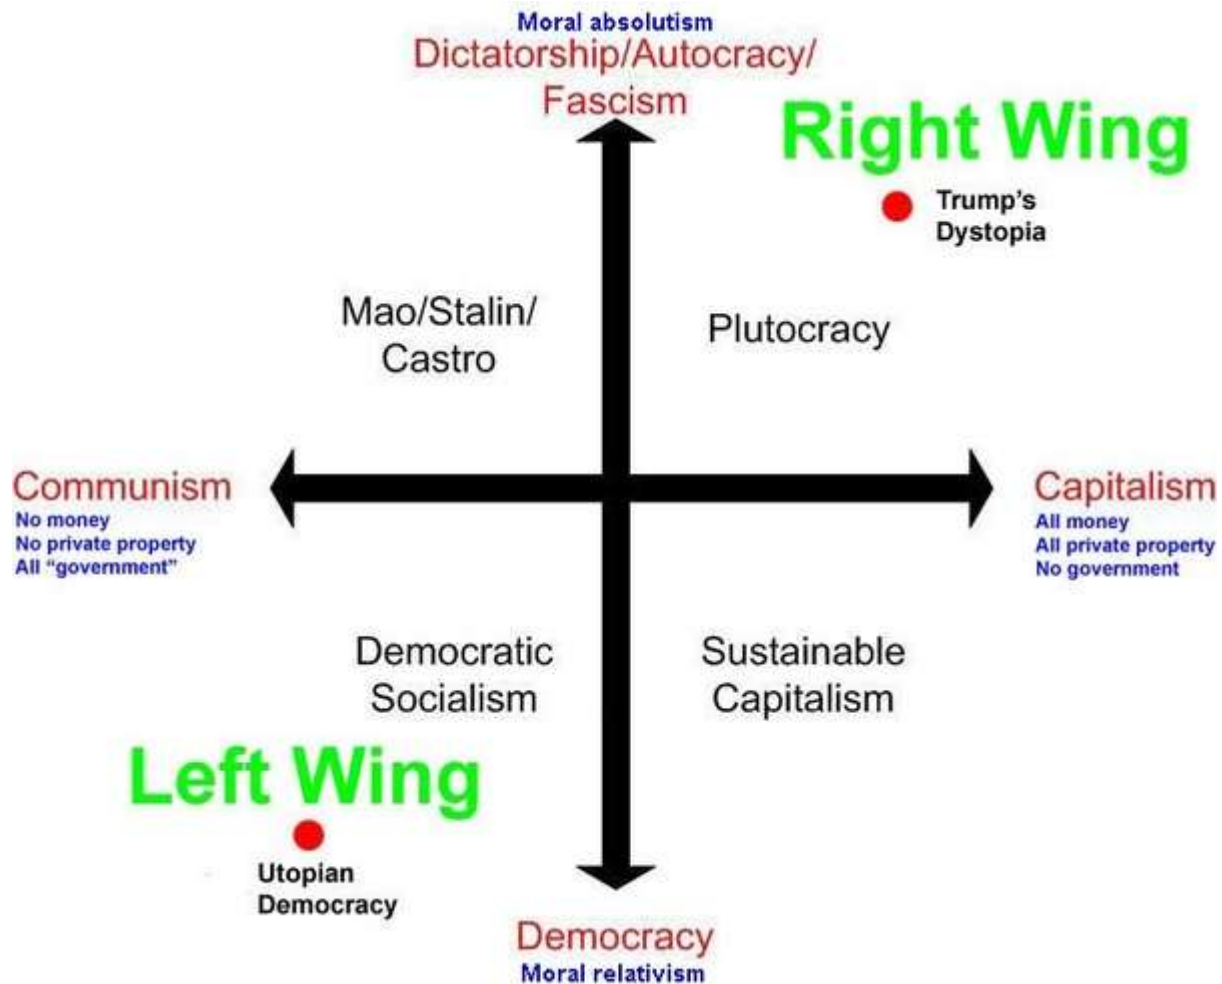

Core to the utter failure of American democracy in 2024 (and to a similar but somewhat lesser extent in 2016) is the impact of social media. Trump has been able to leverage the new social media to create a hallucination, a glorious lie called MAGA, that captured the minds of many Americans. Social media followed by early AI have been key to the destruction of American democracy and the U.S. Constitution under Trump. Once he was handed the keys to the castle, he took America back to the Dark Ages.

Note: I should point out that many great minds have warned about the dangers of democracy. Socrates feared that democracy sowed the seeds for the rise of an idiot demagogue, like Trump. Aristotle worried that the “masses” weren't educated well enough to make decisions about governance, like core MAGA. Democracy absolutely does have its flaws, but they are addressable, and *must* be addressed when you consider the alternatives.

America and the rest of the world are learning much from the Trump debacle. Authoritarian and autocratic dictatorships around the world have been exposed as the dangerous and regressive entities that they are. We've all gone through a horrible learning cycle during which we discovered what we absolutely *can't* have. It takes guns and violence to enforce authoritarianism, but it takes only simple “proofs” to enforce democracy. This is what I am showing in this paper.

The political taxonomy that is determining our future

This graph, which appears on the Internet in a variety of forms, is what I have settled on to show where we are and where we must go to ensure our survival on Earth.

I've been showing this graph to people for many years and the single biggest criticism I get of it is that the rule of the majority (democracy) is just as bad as any authoritarian rule. To which I reply: At least the rule of the majority is utilitarian – the most common and universal good is derived from it, as opposed to some arbitrary authoritarian rule of a minority or even just one person. Any rule other than democracy can only come from some sort of arbitrary moral imperative or theology that is accepted on faith or by some other assumed (or forced) acceptance of an ideology that is assumed correct absolutely – and without needing any sort of empirical verification to be seen as valid. Democracy is empirical; authoritarianism is strong-arming people into compliance through explicit or quiet, unrelenting propaganda.

The most destructive trends in modern civilization involve moving from the bottom left to the upper right in the graph. That move toward authoritarianism plus unfettered capitalism represents the devolution of the human species. On the other hand, moving from the upper right to the bottom left represents enlightenment and true human progress. Democracy is where we hash out the *universal values* of humankind and must be fostered at every turn if the species is to survive. The move toward autocracy, demagoguery, and unchallenged lies must be resisted as though our lives depend on it, which they do. For far too long the issues popular with the vast majority of Americans like universal healthcare and strict gun control have been suppressed by the right-wing powers-that-be, who have figured out

how to get what they want for the oligarchs, corporations, and other super-rich and powerful people and entities, despite what is popular with the American public.

Authoritarianism, autocracy, and right-wing fascism are not at all necessary. Trump is the poster boy for authoritarianism, autocracy and right-wing fascism. America somehow elected this man into office twice, and we are paying dearly for it now. But we must always remember that authoritarianism, autocracy and right-wing fascism – even if we somehow vote them into our federal government – are horribly destructive of democratic values, and the longer America is run like this then the harder it becomes to return to the great American experiment in democracy.

How capitalism has failed us, and will continue to do so unless we fix our global economic systems right away

For centuries, capitalism worked, more or less. The fit with human nature seemed mostly acceptable, and the globe was lifted out of the darkness of the pre-Enlightenment curses of superstition, bigotry, irrationality, and unquestioned faith in and devotion to arbitrary human and religious hierarchies. China in particular has shown how capitalism was able to bring hundreds of millions out of rural anonymity and into modernity. China now competes on the world stage with America herself and in fact could soon overtake America as the most powerful country in the world. But this is not to say that we likely wouldn't have been better off if humans had stayed primitive to a large degree, as we wouldn't have depleted the critical resources of the planet and turned the whole sphere into an unfortunate "Easy Bake" oven with the global warming that has resulted from the industrial age.

For capitalism to work, you need abundant renewable and non-renewable resources, which Mother Earth has been happy to provide – until now. For the sake of the planet, it likely would have been better if we had stayed rural and "backwards." The planet would be in far better shape if "primitive" societies still constituted the bulk of humanity. Without a basically unlimited supply of renewable and non-renewable resources (which are essentially private property under the capitalist system), you have nothing. Capitalism is obviously failing now because it has exploited the abundance of the planet with impunity, with no plan toward sustainability. Early in the industrial revolution (though unconscionable exploitation of labor was a hallmark of early capitalism) capitalism was "successful" in employing most people and generally increasing the "standard of living" and increasing lifespans for most citizens of the planet. That's no longer true. Capitalism's destructive and exploitative nature now is counter-productive to the survival of the species and has to be reined in if we are to survive.

The wealth gap and the rise of the oligarchy are now taking control of politics in addition to continuing to amass the majority of the wealth of the planet. The stock market is a barometer of how badly we are compromising planet Earth. The market goes up when the planet is basically "up for sale," and it goes down when a lid has been placed on the party — the punch bowl has been taken away, so to speak. Capitalists like Trump do not like the punch bowl to be taken away, and they really like it when they get all the punch they want. They don't want to be restricted in any way. Having billions of dollars certainly removes most restrictions on someone, but giving one of these guys the position of POTUS is terracide. A whole global class of depraved oligarchs – who used to simply concern themselves with building wealth – are now gaining total political control of the planet. These are not the people we want running things. For example, in his second term Donald Trump has corruptly used his position as POTUS to make billions of dollars for himself and to give his personal friends and campaign contributors special favors, just like any corrupt dictator of a third-world government. Most egregiously, he basically handed over

Venezuela's vast oil reserves (the largest in the world) to American oil companies (whom he *told* to give him \$1 billion for his 2024 campaign). He used the U.S. military and taxpayer money to invade the country and abduct President Maduro, all for the benefit of private oil interests. This certainly is the worst example of how modern American politics uses the government and public money for private gain. And, stunningly, hardly a single Republican politician objects. Trump continues to route taxpayer money to the super-rich. Many are simply using their massive tax cuts to buy federal debt (the very debt they are creating with these tax cuts) or they tuck it away for themselves via corporate stock buybacks – or by investing in AI.

AI helps the super-rich and their companies shed jobs and be more “productive” and profitable (so much for “trickle down” economics). In their search for ever more productivity from every laborer, the oligarchs and their companies are now “automating away” jobs and creating a permanent underclass through the use of robotics and AI. Capitalism is now failing badly. But few dare to speak up. Trump has even tried to make it a crime to criticize capitalism. My very words right now may soon be considered a felony. The oligarchs know that without capitalism, they are nothing.

The most valuable assets on the planet come from the planet itself — clean air, clean and plentiful water, and protected areas like federal land. Non-renewable resources like coal, oil and copper are especially valuable because there is only a limited supply of them. Because of humans, planet Earth will eventually be a dead, hollowed-out shell, robbed of all non-renewable resources and unable to renew renewable resources because the soil, air and water have been so badly compromised. Sustainability and a roaring stock market are at complete odds. Companies look at financial performance just four times a year (each quarter). In hyper-competitive economic systems like capitalism, the future is moot. Environmental sustainability and a clean planet are a pipe dream that only gets in the way of competitive advantage *today*. Capitalism doesn't care about the future. It continues to concern itself only with short-term profitability and competitive advantage in the current fiscal quarter. To worry about anything else is death for a company. To adopt environmental and sustainability standards simply puts a company at a competitive disadvantage that can mean the difference between staying in business and not. That, it turns out, is the true nature – and consequence – of capitalism.

In the graph, above, I show where “sustainable capitalism” falls. But I have come to realize that the term is an oxymoron. I left it in the graph, anyway, for this paper, for historical reasons. You can “google” the term if you like.

Meanwhile, climate change rages on, predictably warming the planet and ensuring that it becomes basically uninhabitable by 2100. The Trump administration, ironically and criminally led by Trump's EPA chief, has now stripped all regulatory power from the EPA, and the fossil fuel industry powers on, unimpeded. Trump crippled green energy in America to ensure that the oil industry that supports him so completely will run into no impediments to profitability. This is the fate of humanity under capitalism and many scholars believe we are past an environmental turning point. Private interests now run the government and they are ensuring that they are not burdened with environmental and sustainability regulations. Children born today are being given a front-row seat to the final destruction of the planet and most life thereupon.

Unrestricted capitalism is the mechanism for turning the core intrinsic value of the resources of the planet into money. The great giveaway of planet Earth to the 1% continues unabated under a financial

regime of the unabashed, immoral, and self-centered pigs of humanity. Our survival is in imminent peril. To deny that is to be a total fool.

Diversity and input from indigenous people are key to finding sociological and political truth

So what I am suggesting is a sort of modern-day real-time scientific approach to the study of societies and civilizations. Indigenous people are as key to this as our huge urban centers. Losing indigenous people is akin to destroying the natural resources of the planet.

The rich diversity of our planet is critical to forming the wide array of viewpoints and stances that are the input to our social systems and social democracy. Living in the empirical world is made richer by environmental diversity, and anything that gets in the way of fostering that diversity is criminal. Private property – the foundation of capitalism – doesn't foster this. On the contrary, the great fortunes are built on the absolute destruction of the foundation of diversity – the non-renewable and renewable resources in which we nest.

Authoritarianism and fascism seek to destroy diversity and implement their own abhorrent culture. Hitler's attempt at this was labelled *gleichschaltung*. Trumpism defies and ridicules what it calls "wokeism" – which is really just diversity.

***Gleichschaltung* — German word for the process by which Hitler and the Nazi Party systematically brought all aspects of German society, including cultural institutions, in line with Nazi ideology and policy.**

***Trumpism* — American word for the process by which MAGA is implementing the goals of Project 2025, including hijacking the Kennedy Center and changing exhibits at the Smithsonian to conform with Trump's interpretation of American history.**

Voting and the role of consensus in truth – Newsflanks.com

Voting yields majority consensus. If everyone voting can show that they understand the facts behind the issues – at least insofar as the facts can be agreed upon to be the facts – then you get a valid vote. However, if parties are propagandized to such an extent that they actively believe lies, then that won't work, as America saw in the 2024 election when Donald Trump was unbelievably re-elected to another term as president.

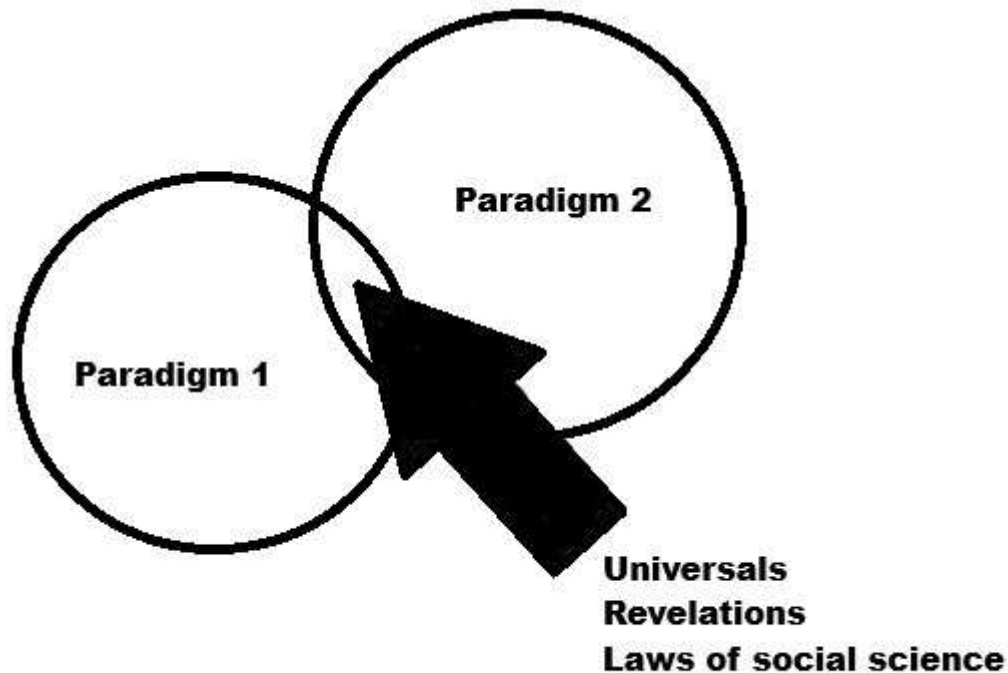

My website – Newsflanks.com – seeks to find majority consensus on issues by educated and aware individuals from diverse backgrounds who display solid critical thinking skills. Online voting *must* become a reality because direct democracy (where everyone votes directly on all issues) must become a reality. But actual testing will be required before people cast their votes to ensure they do in fact understand the issues and can make a rational choice. Lies are the enemy of humanity.

Note: Many oppose direct democracy, for a variety of reasons. Addressing those arguments is beyond the scope of this paper. Similarly, many oppose online voting. That's mostly because it's difficult to absolutely authenticate a user and verify that it is in fact he who is actually voting. However, this problem is solvable with online monitors who oversee the voting activity of every participant. Online voting, test taking, and vote monitoring are essential for democracy today, and all are absolutely achievable.

On my website, a "flank" is a collection of users who respond to some number of binary questions (yes/no) with the same answers. A binary question is defined as consisting of two possible answer choices (not including "no opinion"). A "counterflank" is the converse of a flank—i.e., a collection of users with exactly the opposite answers as those in the corresponding flank. The flank (vs. the counterflank) includes the user for whom the flank and counterflank are getting generated.

Questions are organized into surveys. I try to make a survey equivalent to a paradigm so that a flank represents a collection of people who conform to an instantiation of the paradigm. A counterflank is then the competing paradigm.

Newsflanks provides two especially unique windows into survey results: flanks, and revelations. Flanks were already just discussed. Surveys are kept short to ensure that flanks/paradigms emerge so that the two sides of answers (flanks and counterflanks) to a survey become clear. We want clear and distinct flanks to understand the core reasons behind disagreement on the issue or issues addressed by a survey. Ideally, we want half of the respondents to agree with you, and the other half to disagree. However, a small amount of overlap is key. *Overlap maps to Kuhn's anomalies.* For example, in the political graph, above, the Left and the Right do indeed find agreement on some issues, and that's what makes the overlap anomalous. In the social sciences, these anomalies are the clearest, the most revealing, the most sought after, and the most empirically verifiable laws of social science, as they have the greatest consensus:

We seek “revelations” on Newsflanks. A revelation is a point of agreement, hopefully unanimous, in a survey. Even better, the other responses should break 50% - 50%. In a larger context, revelations are “universals” in the same sense that scientific “laws” are universals. But they can shift in the same way scientific “laws” can shift in the Kuhnian sense.

Ideally, flanks can be mapped to groups of people who share clear cultural and sociological backgrounds, or other characteristics such as shared talents, abilities, or special interests. From this data we can analyze how people’s backgrounds and experiences lead them to believe as they do. Revelations give insight into “universal” values and beliefs – or at least widely held beliefs that prevail within a superset of people with otherwise opposite flanks. These are both the political and sociological aspects of newsflanks.com.

A little bit more about Kuhn, Wittgenstein, and paradigms

The Kuhnian paradigms of natural science are highly defined systems used to explain natural phenomena. The Wittgensteinian paradigms of the social sciences are similar in that they form mostly coherent theories about how society operates (or should operate), but they are not so tightly constructed that the “refutation” of a subset of principles by another paradigm will destroy the whole paradigm. Comprehensive paradigm destruction and dramatic, comprehensive paradigm shifts happen far more in natural science than in social science. *In social science, paradigms are most useful for determining areas of agreement, not disagreement.* One paradigm “destroying” another in social science because it is better able to explain a particular area of observed natural phenomena happens far less in the social sciences than the natural sciences.

Natural science depends on verifiable theories and truths. If you can replicate the results of an experiment, then you have real truth and real knowledge. The same applies to the social sciences, but not as rigorously. Consensus among social scientists and others is critical to the social sciences, but that consensus is mostly verbal and oftentimes difficult – if not impossible -- to demonstrate in the field.

The Vienna logical positivists were key to setting in stone this approach to science and knowledge. The early writings of Wittgenstein served as a sort of logical empirical foundation for the absolutely true knowledge sought by the positivists. Wittgenstein showed us how we can map our paradigms onto empirical reality.

Elections can also provide validation of previous votes, as do the successes and endorsements of other successful societies. When things get bad, we get close votes. When they are good, the majority is clear in its endorsement – validation – of success and truth. Peaceful and well-engineered societies that simply provide the platform for happy lives without denigrating the environment and ruining our future are key to demonstrating all the proof we need to show that our social hypotheses and theories are *correct*.

Thomas Kuhn's *The Structure of Scientific Revolutions* describes how scientific "paradigms" evolve in scientific communities. Creation of these paradigms seemingly demonstrates objective empirical research but in fact includes the personal biases of the scientists themselves. Kuhn explains that scientific "progress" involves one paradigm being "proved" wrong and another paradigm then replacing it. Nevertheless, despite what appears to be relative points of view as expressed in these paradigms, science does move forward in its understanding of the physical world, as proved by humans' ability to take this knowledge and manipulate physical reality.

The same paradigms form in the social sciences. Ludwig Wittgenstein's later work, in particular *Philosophical Investigations*, published shortly after he died, shows this. His so-called *Blue and Brown Books* were the preliminary writings that led to *Philosophical Investigations*.

Wittgenstein describes how social scientists and humans in general create paradigms built on the vagaries of human language itself to communicate and jointly view the world. Peter Winch's *The Idea of a Social Science* explains exactly how Wittgenstein did this, but he comes to a drastically different conclusion than what is presented here about the relationship between the hard sciences and the social sciences.

I studied Wittgenstein, Winch, Chomsky and other language/linguistic and history of science philosophers in college and graduate school. I was even fortunate enough to be able to take a course from one of Wittgenstein's former students, the late John Wisdom. Wisdom – certainly an appropriate last name – helped his students work through his arguments regarding "other minds" and how we can determine whether we are all in fact sharing what appears to be the same epistemological frameworks for communicating about the world, or whether we just *think* we are.

Social paradigms carry over into interpretation of the law as well as voting. The same events can be interpreted in entirely different ways based on the personal biases and ideologies of the observer. The shooting of Renée Good by ICE agents in Minneapolis this year demonstrated this. Democrats and Republicans came up with two entirely different explanations of what happened, demonstrating how

the two different political persuasions can influence actual visual interpretation, similar to a Rorschach test. The two paradigms clashed, just like Kuhn's scientific paradigms.

The mystery of language and mind, and the rise of AI

AI is as dangerous as it is beneficial. We have to get this right. AI can create a hallucinated world, or a thoroughly vetted, empirical, and truthful one. We just have to develop and deploy AI correctly.

Kuhn's paradigms show how we meticulously discover the physical world, while Wittgenstein's social "paradigms" unveil how we discover how human society works. AI is a *demonstration* of how the human mind works. When used with debate and consensus, we come much closer to understanding ourselves than we would without AI. Noam Chomsky's innate capabilities of the mind and language (see "truth table" earlier in this paper) appear over time in our AI, by *demonstration*, which is the only way we can objectively see them and understand them. As Hume showed us, our knowledge is mostly inductive and based on experience. Chomsky's innate capabilities of the mind are a mystery until we see them in action, until they are *shown* to us, which is what AI does. Our intelligence is demonstrated to us in all its mysterious glory. The most famous example of this, as explained by Chomsky, is the inexplicable way a child is able to suddenly begin building sentences and use other logical constructs in ways he has never heard before. Something kicks in. AI enables our full intelligence to "kick in," so to speak. AI *shows* us how *smart* we are.

Before neural networks and vast matrices built with massive databases and a stunning number of GPUs, I denied that we could ever build an intelligence greater than our own, because we couldn't actually step outside of ourselves and see how our minds work. I wrote a paper about this when I was in college and studying AI. I didn't believe we could build a machine that could even pass the Turing test. But at that time our AI was built around deductive logic, not inductive logic. It took an actual demonstration, at scale, by huge and fantastic machines and processors operating based on induction rather than deduction to create an intelligence as great – and possible even greater – than our own.

Philosophically, it's interesting to note that Wittgenstein's intellectual development followed a similar pattern. From *Wittgenstein's Conception of Philosophy*, by K.T. Fann (1971):

We have seen what 'can be said' according to the *Tractatus*: that, and only that, 'can be said' which is capable of being true or false, so that which of the two possibilities is actual has to be decided by 'comparing the proposition with reality.' A proposition has 'sense' in so far as it is a logical picture of the world. But no picture can be true *a priori*. It is impossible to tell from the picture alone whether it is true or false without comparing it to reality. Logical propositions are true *a priori*, they are tautologies and their negations are contradictions. Thus, '...the propositions of logic say nothing', they are senseless. Nevertheless, they are not nonsensical, for they *show* 'the formal-logical-properties of language, and the world', or the limit of language and the world.

...

[In the *Investigations*] The purely *a priori* method of the *Tractatus* is under attack and he now recommends (in a certain sense) the *a posteriori* method of investigating the actual phenomenon of language. This shift of *methods* is what constituted the break between the earlier and the later Wittgenstein.

If civilization continues to march toward authoritarian regimes, we will never understand how we really "work." Violence and "might makes right" will destroy society and end human beings' life on Earth, as

well as that of other species. Our reality will continue to be rigged by the super-rich oligarchical powers-that-be, and we will live in illusion. AI, if abused, will facilitate that. Unfortunately, it already is.

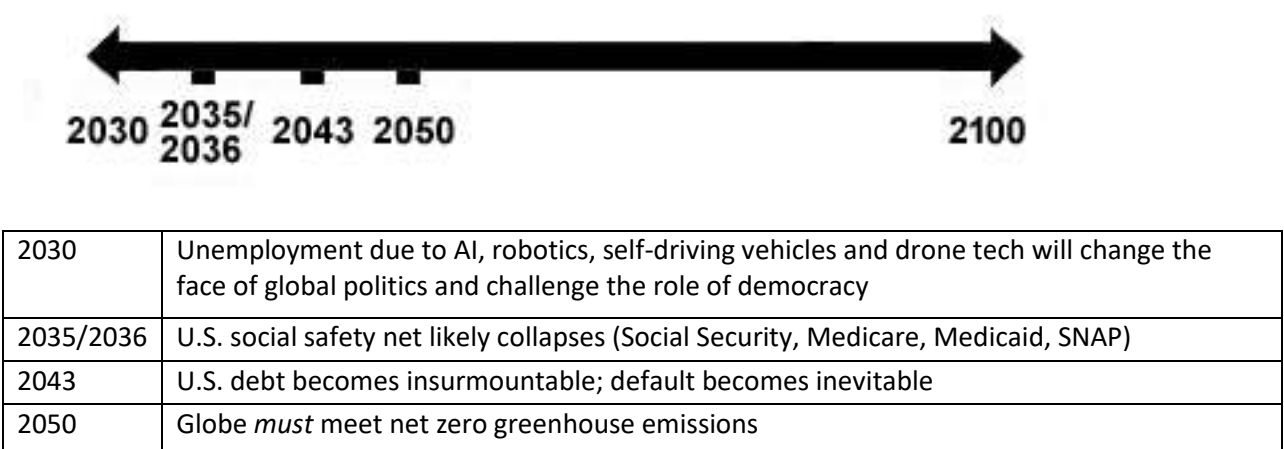

But AI’s Platonic models (like Plato’s allegory of the cave), the Kuhnian paradigms, Wittgenstein’s rule-based private language games and the “pictures” described in the *Tractatus*, democracy and voting – these can be used to show how society can progress both scientifically and intellectually. They can be deployed equally well in both the physical and social sciences. Ultimately, the distinction between physical and social science is merely one of degree and difficulty, but they are both the same human endeavor, and both can be enhanced with great AI. AI will likely even prove useful in analyzing its own paradigms to find anomalies, universals, and contradictions. AI will help us build better social and political systems built on real data. But in the end it will still be humans who decide among the paradigms, and establish the empirically verifiable scientific laws and social universals that govern our time on earth.

It’s also important to point out that humans will always be needed to provide the empirical data upon which AI models are trained and paradigms are created. We’re the ones who can see, feel, hear, taste, and smell. It is critical, though, that we live in rich and diverse social and natural environments, and in free and open cultures. That’s how the best empirical data is generated by us for consumption by our machines. We are creatures of the earth; robots aren’t.

Simply stated, AI finds answers to our queries – big and small. The answers it provides are based on the best consensus in the data that the model was trained upon. When AI is done right, the answers delivered are obviously the most firmly grounded in empirical reality. In other words, the most empirically *true*. The more data, the better. AI aggregates answers to queries and then tests all possible answers against all known scenarios. It can create stunningly complex paradigms that are often at odds with one another, and it resolves the differences. But our help is still key. With our help – AI and humans working together – we can resolve differences to find empirically verifiable universal laws and truths.

Tomorrow

Unless we do something – and fast – here’s what coming for America and the rest of the world:

2100	If we fail by 2050 to meet net zero greenhouse emissions, the collapse of Earth's natural systems that previously underpinned organized human activity on the planet is assured
------	---

National unemployment, national bankruptcy, global environmental devastation – all “end game” serious, and very likely. The only solution to fixing this mess is to view and implement social science as a hard science that enlightens us all to rock-solid empirically verifiable *truth* – and ensure *everyone* is included. If lies and global delusion are allowed to continue, if we continue to conflate victimless values with the truly impactful values that are indeed having the core impact on our society, there's no hope. We have to separate the wheat from the chaff. Comprehensive national and international democratic mechanisms must be shored up and expanded, or we will all simply wind up as dupes with a front seat to the end of humankind's saga and utter failure on planet Earth.

Human society must move toward more democracy and wealth equality. This must be accompanied by a universal living wage and universal basic income (UBI). AI, robotics and drones will come to automate most of the work that needs to be done over the next twenty years, and we will all need to rationally determine how we can all live together in sustainable, just, and fair societies. Empirical and social/scientific analysis via a rich diversity of scientific paradigms (in natural science *and* social science) and voting can and will undergird our efforts with solutions that we all can agree are credible, sustainable and – most of all – truthful.

Every person and critter born on Earth deserves to enjoy the planet, free of authoritarian rule and exploitation. Humankind has the tools to make that happen. We just have to use them – and no longer abuse them. Everyone must participate (vote) to ensure the common good. Democracy and education – the two things authoritarian regimes hate the most – must flourish. We can't let any single group with any single value system, agenda, or way of life – especially billionaires – dominate the lives of the many.

There's much to be done, and a very short time in which to do it. If humankind does in fact become rational and is able to evolve human society on Earth based on empirical fact (as best as we can use paradigms to accomplish this) then there is a glimmer of hope that we will continue to move forward and survive – even thrive!

–End–
